NAME : S. karthika

MOBILE NO : 9042647125

Single Page Application (SPA)

A Single Page Application (SPA) is a web application or website that interacts with the user by dynamically rewriting the current page rather than loading entire new pages from a server. This approach provides a more fluid and responsive user experience, similar to that of a desktop application

Problem Statement

Creating a user-friendly and scalable product catalog with dynamic filters is a key goal. This approach aims to address several problems:

- * **Poor Customer Experience:** Customers get frustrated and abandon their carts when they can't quickly find products in large catalogs.
- * **Inefficient Product Management:** Marketing and sales teams struggle to manage and promote products without centralized, filterable data.
- * **Lost Sales Opportunities:** The inability to quickly narrow down options negatively impacts conversion rates and revenue.

Users & Stakeholders

The project benefits several user groups:

- * **End Users:** Shoppers looking for a quick and relevant product search and filtering experience.
- * **Product Managers:** They need insights into product performance and user preferences to make strategic decisions.
- * **Marketing Teams:** They require easy product categorization and promotion tools for effective campaigns.
- * **Sales Teams:** They need quick access to up-to-date product information and availability to assist customers.
- * **Developers & QA:** They are responsible for building, maintaining, and validating the system to ensure robust performance.

MVP Features

The Minimum Viable Product (MVP) includes essential features to address the core problem and provide immediate value:

- * A product listing that shows essential details like name, image, price, and SKU.
- * Dynamic filters for category, price range, brand, and availability.
- * A search bar with intelligent autocomplete suggestions.
- * An admin interface for managing products and filters.
- * A responsive design that works seamlessly on desktop and mobile devices.

Next Steps

Future development will focus on:

- * Gathering Feedback: Collecting user feedback from the MVP launch to prioritize future enhancements.
- * Expanding Filters: Adding advanced filtering options like ratings, reviews, and new arrival indicators.
- * Integrating Systems: Connecting the catalog with existing inventory, order management, and CRM systems.
- * Innovating: Exploring AI-powered search, machine learning for personalized filtering, and recommendation engines.
- * Continuous Improvement: Developing a long-term roadmap for feature development, performance optimization, and scaling.

Acceptance Criteria

The MVP must meet specific criteria to be successful:

- * Seamless Filtering: Users can apply multiple filters simultaneously, with the product list updating instantly and accurately.

- * **Effective Search:** The search function provides relevant products and useful autocomplete suggestion.
- * **Robust Admin Control:** Admins can add, edit, and delete products and filters without errors.
- * **Universal Responsiveness:** The user interface maintains full functionality and visual appeal across all devices.
- * **Performance at Scale:** The system efficiently handles at least 10,000 products with fast filtering

API Endpoint List

The backend support for the features of the product catalog includes several API endpoints:

- * **GET/products:** Fetches a product list with optional filter query parameters, for example, `/products?category=electronics&price_min=100`.
- * **GET/products/{id}:** Retrieves detailed information for a specific product using its unique identifier.
- * **POST/products:** Adds a new product to the catalog, an action that is restricted to admins and requires authentication and valid product data.
- * **PUT/products/{id}:** Updates existing product details by its ID, supporting partial updates; this is also for admins only.
- * **GET/filters:** Retrieves dynamically available filter options such as categories, brands, and price ranges for the frontend display.
- * **POST/filters:** Creates or updates filter categories and their values, a function reserved for admins only.

Benefits and Impact

The filtered product catalog is expected to have several benefits and impacts:

- * Increased User Satisfaction and Conversion Rates: Faster product discovery directly leads to a better user experience and higher conversion rates.
- * Reduced Operational Overhead: Streamlined product management processes reduce the need for manual effort and operational costs.
- * Enhanced Marketing ROI: Marketing teams can use filter-driven promotions to execute highly targeted campaigns, which enhances their return on investment.
- * Scalable Foundation: The MVP provides a strong foundation for future enhancements like personalized recommendations and advanced analytics.
